

Explore a Career as a

DATABASE ADMINISTRATOR

What do Database Administrators do?

Database administrators (DBAs) use specialized software to store and organize data, such as financial information and customer shipping records. They make sure the data is available to users and is secure from unauthorized access. DBAs sometimes work with an organization's management to understand the company's data needs and to plan the goals of the database. They may also work with computer and information systems managers to provide database solutions. DBAs are responsible for backing up systems to prevent data loss in case of a power outage or other disaster. They also ensure the integrity of the database, guaranteeing that the data stored in it come from reliable sources.

Training & Educational Opportunities

You will have many opportunities for employment as a database administrator, but first you will need to complete specific training and earn a bachelor degree. Firms with large databases may prefer applicants who have a degree focusing on data or database management, typically either in computer science, information systems, or information technology.

As a Database Administrator you will:

- Back up and restore data to prevent data loss
- Ensure that organizational data is secure
- Ensure that the database operates efficiently and without error
- Identify user needs to create and administer databases
- Maintain the database and update permissions
- Make and test modifications to the database structure when needed
- Merge old databases into new ones
